

Greedy Algorithms

1-G-Coin Problem:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of {1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanation:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

```
1 #include <stdio.h>
2
3 int main() {
4     int V;
5     scanf("%d", &V);
6
7     int m[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};
8     int n = sizeof(m) / sizeof(m[0]);
9     int count = 0;
10    for (int i = 0; i < n; i++) {
11        while (V >= m[i]) {
12            V -= m[i];
13            count++;
14        }
15    }
16    printf("%d\n", count);
17    return 0;
18 }
19 }
```

	Input	Expected	Got	
✓	49	5	5	✓

Passed all tests! ✓

2-G-Cookies Problem:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child i has a greed factor $g[i]$, which is the minimum size of a cookie that the child will be content with; and each cookie j has a size $s[j]$. If $s[j] \geq g[i]$, we can assign the cookie j to the child i , and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number.

Example 1:

Input:

```
3
1 2 3
2
1 1
```

Output:

```
1
```

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Constraints:

```
1 <= g.length <= 3 * 10^4
```

```
0 <= s.length <= 3 * 10^4
```

```
1 <= g[i], s[j] <= 2^31 - 1
```

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int cmp(const void *a, const void *b) { return (*(int*)a - *(int*)b); }
5
6 int main() {
7     int n, m, i = 0, j = 0, ans = 0;
8     scanf("%d", &n);
9     int g[n]; for(int k=0;k<n;k++) scanf("%d",&g[k]);
10    scanf("%d", &m);
11    int s[m]; for(int k=0;k<m;k++) scanf("%d",&s[k]);
12
13    qsort(g, n, sizeof(int), cmp);
14    qsort(s, m, sizeof(int), cmp);
15
16    while(i < n && j < m){
17        if(s[j] >= g[i]){
18            ans++; i++; j++;
19        } else j++;
20    }
21    printf("%d\n", ans);
22    return 0;
23 }
```

	Input	Expected	Got	
✓	2	2	2	✓
	1 2			
	3			
	1 2 3

4-G-Array Sum max problem:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Given an array of N integer, we have to maximize the sum of $\text{arr}[i] * i$, where i is the index of the element ($i = 0, 1, 2, \dots, N$). Write an algorithm based on Greedy technique with a Complexity $O(n\log n)$.

Input Format:

First line specifies the number of elements-n

The next n lines contain the array elements.

Output Format:

Maximum Array Sum to be printed.

Sample Input:

5

2 5 3 4 0

Sample output:

40

Answer: (penalty regime: 0 %)

```
1 #include <stdio.h>
2 #include <stdlib.h>
3
4 v int compare(const void *a, const void *b) {
5     int x = *(int*)a;
6     int y = *(int*)b;
7     return x - y;
8 }
9
10 v int main() {
11     int n;
12     scanf("%d", &n);
13     int *arr = (int*)malloc(n * sizeof(int));
14     for (int i = 0; i < n; i++) {
15         scanf("%d", &arr[i]);
16     }
17
18     qsort(arr, n, sizeof(int), compare);
19
20     long long sum = 0;
21     for (int i = 0; i < n; i++) {
22         sum += (long long)arr[i] * i;
23     }
24
25     printf("%lld\n", sum);
26
27     free(arr);
28     return 0;
29 }
```

	Input	Expected	Got	
✓	5 2 5 3 4 0	40	40	✓
✓	10 2 2 4 4 3 3 5 5	191	191	✓
✓	2 45 3	45	45	✓

Passed all tests! ✓

5-G-Product of Array elements-Minimum:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Given two arrays array_One[] and array_Two[] of same size N. We need to first rearrange the arrays such that the sum of the product of pairs(1 element from each) is minimum. That is SUM (A[i] * B[i]) for all i is minimum.

For example:

Input	Result
3	28
1	
2	
3	
4	
5	
6	

```
1 #include <stdio.h>
2 #include <stdlib.h>
3
4 v int compareAsc(const void *a, const void *b) {
5     int x = *(int*)a;
6     int y = *(int*)b;
7     return x - y;
8 }
9
10 v int compareDesc(const void *a, const void *b) {
11     int x = *(int*)a;
12     int y = *(int*)b;
13     return y - x;
14 }
15
16 v int main() {
17     int n;
18     scanf("%d", &n);
19
20     int *A = (int*)malloc(n * sizeof(int));
21     int *B = (int*)malloc(n * sizeof(int));
22
23 v     for (int i = 0; i < n; i++) {
24         scanf("%d", &A[i]);
25     }
26 v     for (int i = 0; i < n; i++) {
27         scanf("%d", &B[i]);
28     }
29
30     qsort(A, n, sizeof(int), compareAsc);
31     qsort(B, n, sizeof(int), compareDesc);
32
33     long long sum = 0;
34 v     for (int i = 0; i < n; i++) {
35         sum += (long long)A[i] * B[i];
36     }
37
38     printf("%lld\n", sum);
39     free(A);
40     free(B);
41     return 0;
42 }
43 }
```

	Input	Expected	Got	
✓	3 1 2 3 4 5 6	28	28	✓
✓	4 7 5 1 2 1 3 4 1	22	22	✓
✓	5 20 10 30 10 40 8 9 4 3 10	590	590	✓
